TO WHOM IT MAY CONCERN:

In accordance with federal law, Eastern Oklahoma County Technology Center was inspected for the presence of asbestos containing materials during August, 1988. Asbestos containing materials are divided into two categories, friable and non-friable. Friable materials are those which can be crumbled by hand pressure and, therefore, have a potential to release airborne fibers if the material is managed or disturbed. Non-friable materials are hard and, therefore, are incapable of releasing asbestos fibers, unless the materials are machined in some way.

According to our asbestos consultant, the Technology Center does not have any friable asbestos in the facility. There is also no non-friable ACM which is likely to become friable in the school building. There are, however, non-friable vinyl asbestos floor tiles in various locations throughout the main building.

The complete inspection report and asbestos management plan is available for review during normal business hours in the school's administration office. If you have any questions on the recent asbestos inspection of the school, contact Mr. Jay McCaskill.

Sincerely,

Dr. Terry Underwood
Superintendent
